Oregon Agricultural Statistics

1983 / 1984

VICTOR ATIYEH
GOVERNOR

OFFICE OF THE GOVERNOR
STATE CAPITOL
SALEM, OREGON 97310

November 5, 1984

Victor Atiyeh
Governor of Oregon

Oregon agriculture is a vital part of this state's economy, growing and producing a rich diversity of products known for quality in markets worldwide.

In producing these basic agricultural products, our reliable Oregon farmers and ranchers generate an important economic benefit to the state--providing direct employment on the farm and ranch, and creating countless thousands of jobs off the farm, as these products course through the various channels of processing, transportation and marketing.

A close look at the valuable information in this publication points out another very significant contribution from Oregon agriculture--a total contribution of some $70.5 million in taxes on farm property and $198 million in salaries during the statistical reporting period.

As Governor of Oregon, I have always been proud of our farmers and ranchers, and their great accomplishments in production, processing and marketing. These accomplishments, as reflected by these 1983/1984 OREGON AGRICULTURAL STATISTICS, serve to reinforce that pride.

Sincerely,

Victor Atiyeh
Governor

VICTOR ATIYEH
GOVERNOR

Oregon Department of Agriculture

635 CAPITOL STREET NE, SALEM, OREGON 97310-0110

Leonard Kunzman
Director
Oregon Department of
Agriculture

October 22, 1984

Agriculture in Oregon is a major resource industry, and its economic importance is truly significant. Dollar values of agriculture products increase dramatically when they enter the processing, handling and marketing sectors. Thus, a raw-value figure of $1.93 billion is multiplied many times over.

The statistics on agriculture production contained in this publication indicate that in the crop year which concluded in 1983, production was abundant--setting records in some instances. Reflected, too, is the continuation of an apparent cycle manifested by generally high production combined with depressed commodity prices. This set of factors continues to affect agriculture throughout the United States.

The comprehensive figures in this publication can tell many stories, and they also serve as a guide to management and policy decisions made by producers, processors, handlers, agriculture support business and government.

As an aid to marketing of agriculture products--an important element if the industry is to prosper--these statistics will prove most beneficial.

Agriculture statistics are a valuable asset to this state's multi-billion-dollar agriculture industry. Data related to both the production and processing of our crops is compiled in this one publication.

This publication is the result of a cooperative venture, bringing together the Oregon Department of Agriculture, the U.S. Department of Agriculture Statistical Reporting Service, the College of Agricultural Sciences at Oregon State University and the many farmers and ranchers of Oregon who provide valuable production data.

One other entity which has a key role in Oregon and nationwide in the gathering and publishing of valuable agriculture statistics is the National Association of State Departments of Agriculture (NASDA), which serves in the administrative role for USDA in hiring and supervising some 3,000 part-time enumerators throughout the nation.

Sincerely,

Leonard Kunzman

FOREWORD

The Oregon Crop & Livestock Reporting Service is very pleased to present the 1983-1984 Agricultural Statistics Bulletin. This publication provides a comprehensive summary of Oregon agriculture and continues the annual series started last year. The response to last year's bulletin was tremendous, with numerous requests ranging from local to worldwide users. These annual historical publications are used in conjunction with current crop and livestock reports to provide the accurate information needed for making sound production and marketing decisions. In addition, these facts help sell Oregon agricultural products, both at home and overseas.

The backbone of the Oregon statistical program is the many farmers, ranchers and agri-business people who provide the basic information. Without their outstanding cooperation and willingness to provide facts this publication would not be possible. To these voluntary reporters we extend a special "Thanks".

The data for this publication was compiled by the Oregon Crop & Livestock Reporting Service and published by the Oregon Department of Agriculture. We also wish to thank the Oregon State University Extension Service and their County Agents for supplying much of the county data.

This bulletin is designed to serve the needs of you, the data user. Please feel free to suggest any changes you believe would improve future issues.

Sincerely,

Paul M. Williamson

Paul M. Williamson
Statistician in Charge

1/ Jan. 1, 1984 Inventory.
2/ Dec. 1, 1983 Inventory.

GENERAL

The value of all 1983 agricultural commodities produced in Oregon, at $1.93 billion, rose 3 percent from the 1982 value of $1.88 billion. However, this value was still slightly below the record high of $1.94 billion established in 1981. The vegetable group posted a 34 percent gain from the previous year and berries were up 11 percent. The tree fruit and nut category lead the losers with a 15 percent decline. Livestock and livestock products, with a $7.2 million reduction, was 1 percent below last year's value. Grain, forage and miscellaneous field crops group remained dominant by registering a $27 million gain from a year ago and represent 36 percent of Oregon's total agricultural value of production during 1983.

Oregon's importance to the national agricultural output is the diversity of its products, many of which are produced almost exclusively in Oregon.

1983 SEASON REVIEW

January 1983 was warmer than normal over all of Oregon. Coastal areas were slightly wetter than normal, while the southwest and high plateau regions were much drier than normal. February was also warmer than average, and all parts of the state received above average precipitation during the month. In fact, most areas west of the Cascades had rainfall that exceeded the long term average by more than five inches. Temperatures during March continued warmer than normal, and precipitation continued heavier than the norm in all parts of the state. Winter wheat was rated in good condition east of the mountains. Most spring planting awaited drier conditions. Most fruit orchards in the Willamette Valley and mid-Columbia regions were two to three weeks ahead of normal. In Harney County, severe flooding around Malheur and Harney Lakes covered thousands of acres of private meadows.

Cooler, drier weather prevailed during the first half of April which enabled growers to get into the fields for spring grain and vegetable seeding. Fruit development was generally early, but some damage occurred on several cold nights. Total precipitation for the season remained above normal for most of the state, particularly in the west where winter wheat still suffered from excess moisture problems. Range condition remained good. May continued the cool, wet spring until the final week when temperatures rose to well above normal and the entire state was dry. By the end of the month, winter wheat development was ahead of normal. Eastern fields were beginning to suffer from dry conditons, while drying was welcomed to aid the Willamette Valley crop. The first half of June continued to be hot and dry. The latter half of the month, temperatures and rainfall patterns were about normal. Some winter wheat was harvested before the end of the month. Cherry picking had also begun while harvest of the bumper strawberry crop was complete. The first hay cutting was complete in most areas, some second cut of hay was rain damaged while still on the ground.

July also exhibited wetter than normal weather conditions. Winter wheat harvest was well along in the east by month's end, while in the west, harvest was just underway. Harvesting activities for all crops, particularly grass seeds, were severely hampered by showers. In the Hermiston-Boardman area, potato digging began in late July. Dry weather prevailed west of the Cascades during August. In the east, scattered showers prevailed most of the month. Bartlett pear harvest began during the second week. By the conclusion of the month, mint harvest was in full swing. Processing vegetable crops were being harvested for most of the month. Mostly dry, warm weather prevailed during September. The state's winter wheat crop was finally all harvested by the first week of the month. Bartlett pears were all picked by mid-month, and winter varieties were being picked throughout the month. By the last week, many early fields of winter wheat had been seeded.

October had some intermittent rains, but mainly continued the dry fall season. Seeding of winter grains was speeded by the good conditions, but germination and crop growth were below normal. The filbert harvest was disappointing due mainly to a high percentage of blanks caused by brown stain. Tree fruit harvest and potato digging were both winding up during November. Temperatures were mainly warmer than average for the month, while total precipitation was above normal for most parts of the state. December was much colder than normal over the entire state. Temperatures in the teens the week following Christmas caused damage to fruit trees and berry plantings.

FIELD CROPS

Rains beginning in September provided good soil moisture for grains seeded in the fall of 1982. Seeding was slowed somewhat by the rains, but emergence was good. Eastern growers took additional measures for control of weeds, especially cheatgrass. Above average rainfall into spring led to disease problems. Warm, clear May weather aided development of fall seeded grains and planting of spring grains. Hot June temperatures sped maturity of fall crops. Despite the hot weather, soil moisture supplies remained adequate statewide, and the combination led to good growth and development of spring crops. Intermittent showery weather from July through the harvest seasons hindered harvest efforts.

A record 62.0 bushel per acre yield led to Oregon's third largest winter wheat crop of record in 1983, despite a decline in acres for harvest. The 1983 crop was 4 percent greater than the 1982 crop. The lowest harvested acreage in six years caused a 13 percent decline in spring wheat production from 1982, despite a record 42.0 bushel yield.

The 1983 barley crop was up 6 percent from 1982 and Oregon's largest crop since 1971. The 61.0 bushel per acre yield was the third largest of record. Oat production was off 6 percent from 1982. A record 80.0 bushel per acre yield could not offset a 12 percent decline in acres for harvest. Corn yields averaged a record 162.0 bushels per acre in 1983, but a decline in acres for harvest as grain led to a crop only 86 percent of 1982's record crop.

Sugarbeet production in 1983 was up 26 percent from 1982. The 28.0 ton per acre yield tied the 1981 record. The fall potato crop was 2 percent less than the 1982 crop. Oregon ranked fourth in the U.S. in fall potato production in 1983. Production of all hay was up 5 percent in 1983, while hop production dropped 24 percent. Oregon producers accounted for 55 percent of the U.S. peppermint oil in 1983. Increases in acreage and yield combined for an 8 percent increase in production from 1982.

VALUE OF PRODUCTION: PERCENT OF TOTAL, BY FIELD CROPS, OREGON, 1983

1/ Preliminary. 2/ Fresh-weight basis. 3/ Includes potatoes canned in soups, stews, and other combinations.

FRUIT AND NUTS

The 1983 Oregon filbert crop declined 57 percent from the 1982 crop to be the smallest since 1976. Poor pollination, frost damage and wind loss due to lush early growth combined for a poor set. A widespread incidence of brown stain also helped to reduce the crop. Despite the domestic shortage, foreign competition kept prices at their lowest levels since 1972. Oregon growers produced 98 percent of all U.S. filberts.

Oregon tree fruit production in 1983 was generally an improvement over 1982. The state's most popularly produced fruit, pears were up 7 percent from 1982. Pears, other than Bartletts, account for the increase with production greater by 19 percent. Bartlett production was down 10 percent. Oregon ranked third in U.S. pear production with nearly one-fourth of the total.

The 1983 sweet cherry crop was a record large crop for Oregon. The crop was 29 percent better than the 1982 crop and 13 percent greater than the previous record set in 1970 and duplicated in 1973 and 1981. Seven percent of the crop went unharvested. Fruit quality was generally good, but late rains caused some splitting, especially in the Willamette Valley. With the large crop, a greater percentage of the crop was processed in 1983 than the previous year. Fresh packing was down 17 percent from 1982. Oregon ranked second nationally in sweet cherry production, accounting for one-fourth of the total U.S. production. Tart cherry production was up 20 percent.

Ranking ninth in the U.S., the 1983 Oregon apple crop improved 3 percent from the 1982 crop. Plum and prune production, however, fell off by 24 percent. Eighteen percent of the crop went unharvested. Poor fruit set and considerable losses due to disease caused the shortage. Peaches were up 8 percent from 1982.

VEGETABLES

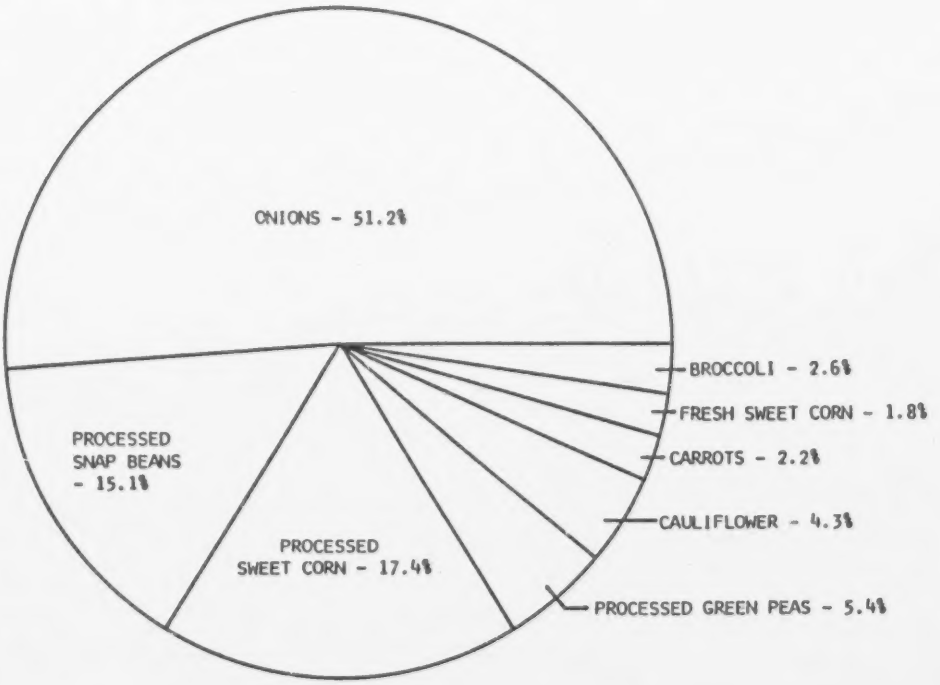
Fresh Market and Dual Purpose

The 1983 production of fresh market and dual purpose vegetables declined 4 percent from 1982. However, the value of these crops more than doubled the level of the previous year on the strength of improved onion prices. Oregon ranked tenth among the states in acreage of fresh market vegetables harvested and seventh in both production and value of these crops. Fresh market vegetables accounted for 40 percent of total Oregon vegetable production. Production of carrots and sweet corn in 1983 decreased due to declines in acreages harvested and yields. Acreage, yield and production all increased for onions. Increased acreage for both broccoli and cauliflower did not offset lower yields resulting in production outputs below the previous year.

Processing

Production of processing vegetable crops decreased 15 percent from 1982 to 1983. The value of these crops also fell by 16 percent. Oregon ranked fifth among the states in area harvested, fourth in production and third in value for processing vegetable crops. Sweet corn acreage, yield and price all declined from 1982. Green pea acreage and yield both increased resulting in a larger crop for 1983, but prices fell enough to lower the total value of production. Snap bean acreage was down and yields were up, but production fell. Prices and value also declined in 1983 for snap beans.

VALUE OF PRODUCTION: PERCENT OF TOTAL, BY VEGETABLE CROP, Oregon, 1983



ONIONS - 51.2%
BROCCOLI - 2.6%
FRESH SWEET CORN - 1.8%
CARROTS - 2.2%
CAULIFLOWER - 4.3%
PROCESSED GREEN PEAS - 5.4%
PROCESSED SWEET CORN - 17.4%
PROCESSED SNAP BEANS - 15.1%

BERRIES

All of Oregon's berry crops showed production increases in 1983 when compared with 1982 levels. The lone exception was the boysenberry crop where both lower harvested acres and a lower yield per acre contributed to a 15 percent decline in total pounds produced. In fact, all other berry crops showed increases in per acre yields.

Strawberry acreage harvested was at the highest level since 1973, and average yield set a record. However, the season average price decreased from the 1982 record, but was still the second highest on record.

Red raspberry acres harvested were unchanged from the previous season. The price per pound plunged to the lowest level since 1980 and total value of production was just 56 percent of 1982's record amount. Black raspberry acreage declined, but increased yields more than offset this, resulting in the production increase. In recent years, the 1980 and 1981 crops were larger than 1983's. Both price and value of production were the highest since 1979. Blackberry acreage remained the same as last year. Yield and production were the highest since 1980. The season average price improved from 1982, but was still 29 cents per pound below the record set in 1979.

Loganberry production was the highest since 1978; however, the price and total value were below that of the previous season. Blueberry yield, production and value were the highest since estimates were begun in 1978.

Although cranberry yield was up from 1982, it was the second lowest since 1971. Acreage also increased from 1982. Total production was 29,000 barrels less than the record set in 1972.

LIVESTOCK

Approximately three dollars in ten of Oregon's agricultural income comes from the production of livestock and livestock products. In 1983, the value of production for all livestock, dairy and poultry totaled 558 million dollars. It's only slightly less (1 percent) than what was generated in 1982, but is the lowest total value of production for livestock groups since 1978. That year, Oregon farmers produced 430 million dollars worth of livestock and livestock products.

About half the livestock value of production each year comes from raising cattle and calves. In 1983, production value slipped 2 percent. Inventory value, however, was 5 percent higher at the end of year than it was on January 1 as pounds marketed in 1983 was off a fourth from the previous year. Average prices for the two years differed little.

Oregon's dairy industry accounts for roughly one-third of the livestock value of production. In 1983, its value of production increased 5 percent from 1982's level, continuing a trend of ever-increasing value since 1965. Higher prices, more cows and record average milk per cow were the reasons milk was one of the few livestock items to increase in value.

Egg production also climbed in value for 1983. A small gain in number of layers with virtually no change in rate of lay multiplied by a higher price per dozen raised the value 6 percent over 1982. Broiler production was off 3 million birds while average price per pound increased a penny.

Hog and pig numbers declined in 1983 as less farrowings and smaller litters were outweighed by marketings, farm slaughter and deaths. Average price per pound and value of production both fell 9 percent.

With production down 16 percent and slightly lower prices, sheep and lamb value of production in 1983 fell 18 percent. Less sheep shorn more than offset the penny increase in price as wool value of production fell 6 percent from 1982.

VALUE OF PRODUCTION: PERCENT OF TOTAL, BY LIVESTOCK GROUPS, Oregon 1983
